

# REAL TIME MONITORING

*Premiere Security Guarding*

## Real Time Monitoring

All Year Security can deploy a real time monitoring patrol system that works on the same principles as the conventional guard patrol checkpoint systems with one additional feature, the Near Field Communications system

This patrol system allows the device to exchange information using GRPS, when the security guard places the device near a checkpoint. The device sends the information to our 24hr control centre instantly, so at every point during the patrol we know the exact location of our security guard.

## Key Benefits

- Transparent, real-time visibility of services delivered.
- Secure and accurate information to and from security officers in the field.
- Instant confirmation of completed tasks and site checks.
- Reduced errors and time spent on manual reporting.
- Accountability and compliance with respect to service agreements.
- Improved security for officers in the field

Other features include, identification & authentication of the security officers, time & attendance reporting by the security officers, reporting on task completion of routine checks and patrols, changes in the client's assignment instructions relating to specific sites and checkpoints, incident reporting including the ability to receive photographs all in real time.

If security patrols were not being carried out as expected...

## When would you like to know?

- A. Never
- B. At the end of the month
- C. When something goes wrong
- D. Immediately

*"our advanced guard patrol monitoring system sends a report of the exact location to our control room, throughout every patrol!"*
